

FastSSO Platform Guide

2026-08-19 | <https://sso.fastsmc.com>

FastSSO is an open-source, self-hostable **enterprise SSO integration broker**. An application integrates once through OpenID Connect (OIDC) or the small REST API, while each customer organization can bring a SAML 2.0 or OIDC identity provider.

One sign-on contract. Every customer's identity provider.

Product Security Integrations API [Sign In](#)

ENTERPRISE IDENTITY CONNECTIONS

One sign-on contract. Every customer's identity provider.

FastSSO gives independent applications one standards-first OIDC boundary while each customer brings SAASPASS, Okta, Entra, Google Workspace, or another SAML/OIDC provider.

INTEGRATION GUIDE · REVIEWED 9 AUGUST 2026

Connect SAASPASS to FastSSO.

The cleanest boundary is SAASPASS as the upstream workforce identity provider and FastSSO as the broker that presents one stable OIDC contract to independent applications.

Design status:

review-ready, not live. FastSSO's upstream OIDC callback is intentionally unimplemented. The adapter must continue to fail closed until metadata, token validation, replay handling, and conformance fixtures pass.

1. Architecture decision

Use a tenant-specific **Generic OIDC** application in the SAASPASS Admin Portal. SAASPASS performs workforce authentication and MFA. FastSSO validates the returned identity, binds it to the selected organization and connection, and issues a separate downstream authorization code to the requesting application.

SAASPASS

Upstream IdP + MFA

→

FastSSO

OIDC RP + identity broker

→

Application

OIDC client + authorization

This will result in SAASPASS passing ID tokens to applications. It also means applications
